

My mobile is getting slow!

1

Install your apps only from official app stores. To improve phone's performance, delete apps and games you are not using.

As I see, your device is full of viruses.

If you install every app the Internet offers, you can get viruses very quickly!

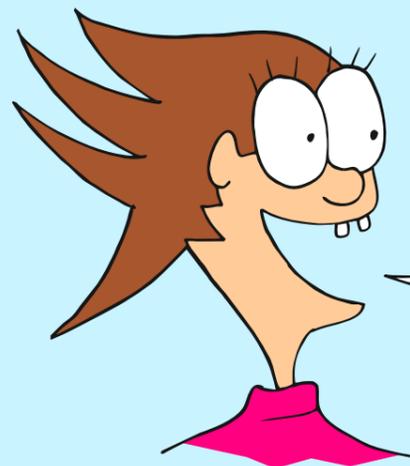

How did I get the viruses? I did not do anything!

You better do something - update your apps regularly. Updates are like a safety belt in a car!

2

If the app asks to be updated, it means the update is necessary.

3

Use antivirus to protect your phone. Antivirus is a program that checks incoming data and provides additional security.

Infecting your device, stealing your money and pictures - isn't it serious?

What can viruses do to me? I'm not afraid!

5

Password protects your device. Make it safe and unique. Use a different password for every app or website.

6

Use a screen lock. Choose PIN, pattern or password.

If you need help:
cert@cert.lv

It is clear now! Safety first!

Remember - everything you post on the Internet stays there forever. Your comments and pictures can be seen by anyone. You won't be able to delete them later.

4

Think before posting - won't you be ashamed if your parents, teachers or friends will see the post or picture?

7

If you suspect a virus in your device, ask your parents or teacher for help.

8

If your phone is lost or stolen, immediately inform your parents so that they can block the device and SIM card.
